Writing unit-tests is hard and time-consuming:

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
```

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

A test execution in PBT consists of:

1. Data generation.

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

- Data generation.
- 2. Property checking.

#### Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

#### Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

- Data generation.
- 2. Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

Writing unit-tests is hard and time-consuming: A property:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

- 1. Data generation.
- 2. Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

A property:

```
forall list <- list() do
   list == reverse(reverse(list))
end</pre>
```

Property-Based Testing (PBT) philosophy: Don't write tests, generate them.

A took avecution in DDT consists of

- Data generation.
- 2. Property checking.
- An shrinking strategy (if the property doesn't hold).

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy: Don't write tests, generate them.

A test execution in PBT consists of:

- Data generation.
- Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

#### A property:

```
forall list <- list() do
   list == reverse(reverse(list))
end</pre>
```

#### In each test:

1. list() generates a random list:

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy: Don't write tests, generate them.

A test execution in PBT consists of:

- Data generation.
- Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

#### A property:

```
forall list <- list() do
   list == reverse(reverse(list))
end</pre>
```

#### In each test:

list() generates a random list:

```
[8 ,10 ,6] ...
```

2. Checks the property:

Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

Property-Based Testing (PBT) philosophy:

Don't write tests, generate them.

A test execution in PBT consists of:

- Data generation.
- 2. Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

#### A property:

```
forall list <- list() do
   list == reverse(reverse(list))
end</pre>
```

#### In each test:

1. list() generates a random list:

```
[8 ,10 ,6] ...
```

2. Checks the property:

```
[8, 10, 6] == reverse(reverse([8, 10, 6]))
```

#### Writing unit-tests is hard and time-consuming:

```
reverse([]) == []
reverse([1]) == [1]
reverse([1 ,2]) == [2 ,1]
...
```

# Property-Based Testing (PBT) philosophy: Don't write tests, generate them.

#### A test execution in PBT consists of:

- Data generation.
- 2. Property checking.
- 3. An shrinking strategy (if the property doesn't hold).

#### A property:

```
forall list <- list() do
   list == reverse(reverse(list))
end</pre>
```

#### In each test:

list() generates a random list:

```
[8 ,10 ,6] ...
```

2. Checks the property:

```
[8, 10, 6] == reverse(reverse([8, 10, 6]))
```

3. If the property doesn't hold returns a counter-example.

### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Imagine a simple counter:

Command	Returns	
start/1	:ok :error	
stop/0	:ok :error	
inc/0	:ok	
get/0	integer()	

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

#### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

### This test can be represented:

#### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

This test can be represented:

To successfully test this program we need to:

#### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

#### This test can be represented:

To successfully test this program we need to:

• Generate sequences of commands.

#### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

#### This test can be represented:

To successfully test this program we need to:

- Generate sequences of commands.
- An internal state to track the changes in the program.

#### Imagine a simple counter:

Command	Returns
start/1	:ok :error
stop/0	:ok :error
inc/0	:ok
get/0	integer()

#### Unit test:

```
:ok = start(0)
:ok = inc()
1 = get()
:ok = stop()
```

This test can be represented:

To successfully test this program we need to:

- Generate sequences of commands.
- An internal state to track the changes in the program.
- A way to interact with the program under test.

### Basic property of stateful programs:

```
forall cmds <- commands(Counter) do
  :ok == run_commands(Counter, cmds)
end</pre>
```

#### Basic property of stateful programs:

```
forall cmds <- commands(Counter) do
  :ok == run_commands(Counter, cmds)
end</pre>
```

where:

### Basic property of stateful programs:

```
forall cmds <- commands(Counter) do
   :ok == run_commands(Counter, cmds)
end</pre>
```

#### where:

commands/1 generates sequences commands:

```
[start(0), inc(), get(), stop()] ...
```

### Basic property of stateful programs:

```
forall cmds <- commands(Counter) do
   :ok == run_commands(Counter, cmds)
end</pre>
```

#### where:

• commands/1 generates sequences commands:

```
[start(0), inc(), get(), stop()] ...
```

run\_commands executes the generated sequence.

### Basic property of stateful programs:

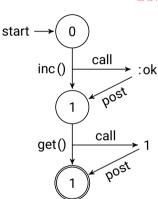

```
forall cmds <- commands(Counter) do
   :ok == run_commands(Counter, cmds)
end</pre>
```

#### where:

• commands/1 generates sequences commands:

```
[start(0), inc(), get(), stop()] ...
```

run\_commands executes the generated sequence.

  end
  command mine() :: :ok do
    next height: height + 1
 end
end
```

When a model is compiled automatically generates documentation.

When a model is compiled automatically generates documentation.

iex> h Blocks

When a model is compiled automatically generates documentation.

iex> h Blocks

# Blocks

Contains a Makina model called Blocks.

Specifies the mining facilities of the blockchain.

## Commands

- mine stored at Blocks.Command.Mine
- block\_number stored at Blocks.Command.BlockNumber

Detailed information about each command can be accessed inside the interpreter:

iex> h Blocks.Command.NAME

## State attributes

- height

. . .

When a model is compiled automatically generates documentation.

iex> h Blocks
iex> h Blocks.Command.Mine.post

**\$ 9 D K \$ E P M EUROP**E

When a model is compiled automatically generates documentation.

```
iex> h Blocks.Command.Mine.post
...
## Available variables
```

#### ### State

- state contains the complete dynamic state of the model.
- height attribute defined in the state declaration.

#### ### Arguments

iex> h Blocks

- arguments contains all the generated arguments of the command.

#### ### Result

- result variable that contains the result of the command execution.
